

Fatoumata Kamara

For project 2 me and my team members decided to create a gym membership database with class bookings. For this I was tasked with doing the sql code and creating all the tables. The members tables were used to store all member's information. Using the INSERT statement to have data inserted to the table. Joins were a necessary part in this project. Without them there would be many missing data connections. For instance it is important to have the bookings table join with the members and class table to see what members and classes are being booked. Having these join makes data retrieval more efficient
